189 **1 Introduction**

190 This document specifies vendor extensions and implementation specific
191 behavior of the ALE HARTING IT Software Development GmbH & Co KG
192 Vendor implementation of the ALE 1.1.1 standard specification.

193 **2 ALE Vendor Interfaces**

194 The HARTING IT Software Development GmbH & Co KG vendor specification
195 for ALE defines two additional interfaces, as defined below.

Interface	Description	Normative section of this document
Digital Input and Output API	An interface through which clients may cause operation to be performed on digital inputs and outputs.	Section 9

196 Table 1: ALE Vendor APIs

197 **2.1 UML Notation for APIs**

198 See Section 4.1 of the ALE specification document.

199 **2.2 Version Introspection Methods**

200 Each of the two HARTING IT Software Development GmbH & Co KG Vendor
201 APIs includes a pair of methods having the following signature:

202 ---

203 `getStandardVersion() : String`

204 `getVendorVersion() : String`

205 This ALE vendor implementation implements these methods for the Vendor
206 APIs as specified in the following table:

Method	Description
<code>getStandardVersion</code>	Returns a string that identifies what version of the specification this implementation of the API complies with. The possible values for this string are defined by HARTING IT Software Development GmbH & Co KG. The implementation returns a string corresponding to a version of this specification to which the API implementation fully complies, and returns the string corresponding to the latest version to which it complies. To indicate compliance with this version 1.1 of the ALE specification, the implementation returns the string 1.1.
<code>getVendorVersion</code>	Returns a string that identifies what vendor extensions of the API this implementation provides. This implementation returns a non-empty string. The value returned is a URI where this ALE implementation is the owning authority. This URI is a HTTP URL which leads to a copy of this document.

207 Table 2: Version Interface Methods

208 For the five standard ALE APIs see section 4.3 of the ALE specification
209 document.

210 **2.3 Classes Common to the Reading, Writing and Digital Input and**
211 **Output APIs**

212 The following six classes are used by all three the Reading API, the Writing
213 API and the Digital Input and Output API. While their names begin with EC
214 prefix used for Reading API classes, they should be understood as belonging
215 equally to the Reading API, the Writing API and the Digital Input and Output
216 API.

Class	Specified in Section of ALE specification Document
<code>ECTime</code>	8.2.2
<code>ECTimeUnit</code>	8.2.3
<code>ECTrigger</code>	8.2.4
<code>ECFilterListMember</code>	8.2.8
<code>ECReaderStat</code>	8.3.10

217 Table 3: List of Common ALE Classes

Class	Specified in Section of this Vendor specification Document
ECSightingSignalStat	5.2.3

Table 4: List of Common Vendor Classes

2.4 Scoping of Names

See section 4.6 of the ALE specification document.
The following table enumerates additional namespaces that are implied by this Vendor-Extension.

Namespace	Section	Scope
PCSpec name	9	Global
PCReport	9.2.3	Enclosing PCSpec

Table 5: List of Namespaces

3 ALE Concepts and Principles of Operation

This section describes the concepts and principles of operation that underlie the specification of the ALE Digital Input and Output API. See also section 5 of the ALE specification document.

3.1 Port Cycles

A port cycle is the smallest unit of interaction between an ALE client and an ALE implementation through the ALE Digital Input and Output API. A port cycle is an interval of time during which operations performed on ports. At the conclusion of a port cycle, a report is sent to the ALE client containing information about what events cause the operations and what the results were.

As in an event cycle, the ALE client specifies when a port cycle starts and stops. During the port cycle, the ALE implementation uses one or more readers to operate on ports when a tag falls within the detection zone of a reader or a trigger event occurred.

The interaction between an ALE client and an ALE implementation through the Digital Input and Output API is similar to the description of the Reading API and Writing API from the ALE specification document section 5.2 and section 5.3. Namely,

1. A client provides to the ALE implementation an *port cycle specification* (PCSpec), which specifies
 - one or more readers (this is done indirectly, as explained in Section 10 of the ALE specification document)
 - port cycle boundaries, and

248 • a set of reports with operations to apply to ports. Each report
249 includes
250 – a filter list that specifies which tags cause port operations to be
251 processed,
252 – a trigger list that specifies which trigger events cause port
253 operations to be processed, and
254 – an ordered list of operations to perform on specific ports
255 2. The ALE layer responds by carrying out the operations on ports, and
256 returning a report that describes what processing was performed on
257 ports, which event causes the port operations and what the results of
258 the operations are.

259 **3.2 Execution of Event and Command Cycles**

260 See section 5.6 of the ALE specification document.

261 If the HARTING IT Software Development GmbH & Co KG vendor imple-
262 mentation receives a second `poll` call for a spec for which there is already
263 an outstanding `poll` call, and the second `poll` call specifies the same pa-
264 rameter values as the first, this ALE implementation satisfies the second
265 `poll` call by initiating a new cycle.

266 **3.3 Execution of Port Cycles**

267 The execution of a port cycle is similar to the description of event cycle and
268 command cycles from the ALE specification document section 5.6.

269 **4 Build-in Fieldnames, Datatypes, and Formats**

270 See Section 6 of the ALE specification document

271 **4.1 Build-in Fieldnames**

272 This section defines the implementation depended behavior for fieldnames
273 that are pre-defined by the ALE specification. The HARTING IT Software
274 Development GmbH & Co KG vendor implementation recognizes each field-
275 name defined in section 6.1 of the ALE specification document and interprets
276 it as defined in the specification. In addition, this ALE implementation im-
277 plements the Tag Memory API and recognizes fieldnames defined through
278 that API (see section 7 of the ALE specification document).

279 **4.1.1 Type of Tags**

280 When interacting with a Gen2 tag, the HARTING IT Software Development
281 GmbH & Co KG vendor implementation behaves as specified in the ALE
282 specification document section 6.1. When interacting with any other type
283 of tag, this ALE implementation will not consider that tag and will exclude
284 any tag types others then Gen2 from all reports.

285 **4.1.2 Memory Bank Fieldnames**

286 The HARTING IT Software Development GmbH & Co KG vendor implemen-
287 tation recognizes any memory bank fieldnames that are specified in section
288 6.1 of the ALE specification document.

289 This ALE implementation supports also reading or writing to the end of a
290 memory bank therefore it will not raise an "operation not possible" con-
291 dition when an attempt is made to read from or write into the `epcBank`,
292 `tidBank` or `userBank` field.

293 **4.1.3 Variable Fieldnames**

294 This HARTING IT Software Development GmbH & Co KG vendor imple-
295 mentation recognizes any string specified in sub-section 6.1.9.2 of the ALE
296 specification document as a valid variable fieldname. This ALE implementa-
297 tion does not support those variable fieldnames for WRITE, READ, ADD and
298 DELETE operations of the Writing API and for the Reading API, therefore an
299 attempt to do so will always raise an "operation not possible" condition.

300 **4.2 Build-in Datatypes and Formats**

301 This section defines the implementation depended behavior for datatypes
302 and formats that are pre-defined by the ALE specification. The HARTING IT
303 Software Development GmbH & Co KG vendor implementation recognizes
304 each datatype and format defined in section 6.2 of the ALE specification
305 document and interprets it as defined in the specification.

306 **4.2.1 The `bits` Datatype**

307 The HARTING IT Software Development GmbH & Co KG vendor implemen-
308 tation recognizes the string `bits` as a valid datatype as specified in section
309 6.2.3 of the ALE specification document.

310 When writing a value of type `bits`, for this implementation the table 22 in
311 sub-section 6.2.3.1 of the ALE specification document is used based on the
312 number of bits in the `bits` value (M) and the number of bits in the field (N).

313 The case $M < N$ only requires writing the entire `bits` value to the field begin-
314 ning at the field's leftmost position. This ALE implementation also pads the
315 remaining part of the field with *zero bits*.

316 **5 ALE Reading API**

317 See Section 8 of the ALE specification document.

318 **5.1 ECSpec**

319 See Section 8.2 of the ALE specification document.

320 *Note that the HARTING IT Software Development GmbH & Co KG vendor*
321 *implementation supports `primaryKeyFields` for all logical readers. This ALE*
322 *implementation will therefore not raise an `ECSpecValidationException` if*
323 *the `primaryKeyFields` parameter is specified.*

324 **5.1.1 ECTrigger**

325 See Section 8.2.4 of the ALE specification document.

326 **5.1.1.1 Real-time Clock Trigger**

327 The HARTING IT Software Development GmbH & Co KG vendor implemen-
328 tation provides support for real-time clock trigger URIs as defined in section
329 8.2.4.1 of the ALE specification document.

330 If the `timezone` parameter within a trigger of this form is omitted this ALE
331 implementation choose the time zone configured in the operating system
332 in which the implementation is running.

333 **5.1.1.2 HTTP Trigger**

334 URIs beginning with the string `urn:havis:ale:trigger:http:` are re-
335 served for triggers specified below. The HARTING IT Software Development
336 GmbH & Co KG vendor implementation provides support for trigger URIs of
337 this form. This ALE implementation conforms to the following specification
338 for all such URIs valid according to the specification below.

339 A HTTP trigger takes the following form:

340 `urn:havis:ale:trigger:http:name`

341 where name is specified below.

Field	Syntax	Meaning
name	A (non-empty) string that is accepted by the implementation according to section 4.5 of the ALE specification Document.	The name of a http web address which should be observed by the ALE implementation.

342 Table 6: HTTP Trigger URI Fields

343 This ALE implementation interprets a trigger of this form as follows. The
344 trigger is delivered each time the specified web address is called via HTTP
345 protocol using the GET operation. The implementation provides a HTTP
346 Web Service to listening on incoming GET operation calls via HTTP protocol
347 in one of the following forms:

348 <http://host:port/implementation-defined-URL/trigger-name>

349 <http://host/implementation-defined-URL/trigger-name>

350 where

- `host` is the DNS name or IP address of the host where the ALE implementation is listening for incoming calls via HTTP protocol using the GET operation.
- `port` is the TCP port on which the ALE implementation is listening for incoming calls via HTTP protocol using the GET operation. The port and the preceding colon character may be omitted, in which case the port defaults to 80.
- `implementation-defined-URL` is the URL part on which the ALE implementation will register triggers defined using the HTTP trigger syntax.
- `trigger-name` is the name of a trigger defined by the user using the HTTP trigger syntax.

362 *Example (non-normative)*

363 *The Condition:*

364 *The implementation provides a HTTP Web Service at the following URL:*

365 <http://<Container Host>:8888/services/ALE/trigger/>

366 *The following trigger URI denotes a trigger that occurs every time the HTTP Web Address:*

368 <http://<Container Host>:8888/services/ALE/trigger/example>

369 *is called via HTTP protocol using the GET operation*

370 `urn:havis:ale:trigger:http:example`

371 5.1.1.3 Port Trigger

372 URIs beginning with the string `urn:havis:ale:trigger:port:` are reserved for triggers specified below. The HARTING IT Software Development GmbH & Co KG vendor implementation provides support for trigger URIs of this form. This ALE implementation conforms to the following specification for all such URIs valid according to the specification below.

377 A port trigger takes one of the three following forms:

378 `urn:havis:ale:trigger:port:reader.type`

379 `urn:havis:ale:trigger:port:reader.type.id`

380 `urn:havis:ale:trigger:port:reader.type.id.state`

381 where `reader`, `type`, `id`, and `state` are specified below.

Field	Syntax	Meaning
<code>reader</code>	A string corresponding to a <code>reader</code> defined through the Logical Reader API.	The name of a logical reader with digital inputs and/or outputs which should be observed
<code>Type</code>	One of the indicators 'in' or 'out'.	The type of the port that should be observed. 'in' means an input port. 'out' means an output port.

Id	A decimal integer corresponding to a port id.	(Optional)The id of the port that should be observed. If the id is omitted the trigger will be fired on every port id of the specified type.
State	One of the decimal integers 0 or 1.	(Optional)The state corresponding to the state of the port that should be observed. 1 means the port is set. 0 means the port is not set. If <code>state</code> is omitted the trigger will be fired on every port status change regardless of the state.

Table 7: Port Trigger URI Fields

This ALE implementation interprets a trigger of this form as follows. The trigger is delivered each time the given port of the defined reader changed the status to the state corresponding to `state`. If `state` is omitted the trigger is delivered regardless of the port state. If `id` is omitted the trigger is delivered regardless of the port id.

Example (non-normative) The following trigger URI denotes a trigger that occurs every time a specified input port state is set:

`urn:havis:ale:trigger:port:ExampleReader.in.1.1`

The following trigger denotes a trigger that occurs every time a specified input port changed its port state:

`urn:havis:ale:trigger:port:ExampleReader.in.1`

The following trigger denotes a trigger that occurs every time a unspecified input port changed its port state:

`urn:havis:ale:trigger:port:ExampleReader.in`

5.1.2 ECReportSetSpec

The HARTING IT Software Development GmbH & Co KG vendor implementation interprets an instance of `ECReportSetSpec` as specified in section 8.2.6 of the ALE specification document.

Note that for the first event cycle to completed after the subscribe call for a given subscriber, and for a poll call, this ALE implementation refer "the prior set of tags" to the empty set.

5.1.3 ECStatProfileName

Each valid value of `ECStatProfileName` names as statistics profile that can be included in an `ECReports`

<<Enumerated Type>>	
ECStatProfileName	
407	TagTimestamps
408	TagCount
409	ReaderNames
410	ReaderSightingSignals
411	<<extension point>>

412 **5.2 ECReports**

413 See Section 8.3 of the ALE specification document.

414 **5.2.1 ECReaderStat**

415 See section 8.3.10 of the ALE specification document.

416 The HARTING IT Software Development GmbH & Co KG vendor implemen-
417 tation adds one `ECReaderStat` for each reader to the `statBlocks` parameter
418 list of an `ECTagStat` and the `ECTagStat` is included in an
419 `ECReportGroupListMember` if the `ReaderNames` statistics profile was in-
420 cluded in the corresponding `ECReportSpec`.

421 The `readerName` parameter of the `ECReaderStat` refers to a logical reader
422 name as named in the defining `ECSpec`.

423 **5.2.2 ECTagCountStat**

424 `ECTagCountStat` is a subclass of `ECTagStat`. The HARTING IT Software
425 Development GmbH & Co KG vendor implementation includes one
426 `ECTagCountStat` in an `ECReportGroupListMember` if the `TagCount` statistics
427 profile was included in the corresponding `ECReportSpec`.
428 `ECTagCountStat` includes all of the fields in `ECTagStat`, plus the following
429 additional fields:

ECTagCountStat	
430	count : int
431	---

432 This ALE implementation constructs an `ECTagCountStat` as follows:

Field	Type	Description
profile	ECStatProfileName	This field contains the TagCount value of ECStatProfileName.
statBlock	List <ECReaderStat>	This field contains an empty list.

count	int	This field contains the count how often this tag was seen within this event cycle by any reader contributing to this event cycle.
-------	-----	---

Table 8: ECTagCountStat Fields

5.2.3 ECSightingSignalStat

`ECSightingSignalStat` is a subclass of `ECSightingStat`. The HARTING IT Software Development GmbH & Co KG vendor implementation adds one `ECSightingSignalStat` for each sighting to the `sightings` parameter list of an `ECReaderStat`, an `ECReaderStat` is added for each reader to `statBlocks` parameter list of an `ECTagStat` and the `ECTagStat` is included in an `ECReportGroupListMember` if the `ReaderSightingSignals` statistics profile was included in the corresponding `ECReportSpec`. An `ECSightingSignalStat` contains signal parameter information about a single sighting of a tag by a particular antenna of a particular host. `ECSightingSignalStat` includes all of the fields in `ECSightingStat`, plus the following additional fields:

ECSightingSignalStat	
host	String
antenna	int
strength	int
timestamp	date

This ALE implementation constructs an `ECSightingSignalStat` as follows:

Field	Type	Description
host	String	This field contains the <code>host</code> name value for this particular sighting.
Antenna	int	This field contains the <code>antenna</code> id value for this particular sighting.
Strength	int	This field contains the <code>strength</code> value for this particular sighting.
Timestamp	date	This field contains the <code>timestamp</code> value for this particular sighting.

Table 9: ECSightingSignalStat Fields

The `readerName` parameter of the surrounding `ECReaderStat` refers to a

454 logical reader name as named in the defining `ECSpec`.

455 *Note the `ECsightingSignalStat` is used by all three the Reading API, the*
456 *Writing API and the Digital Input and Output API. Unless otherwise noted,*
457 *the interpretation of an `ECsightingSignalStat` instance is the same in all*
458 *three APIs.*

459 **6 ALE Writing API**

460 See Section 9 of the ALE specification document.

461 **6.1 CCSpec**

462 See Section 9.3 of the ALE specification document.

463 **6.1.1 CCOpType**

464 The HARTING IT Software Development GmbH & Co KG vendor implemen-
465 tation recognizes every `CCOpType` value as specified in section 9.3.5 of the
466 ALE specification document.

467 **6.1.1.1 CUSTOM Operation**

468 The HARTING IT Software Development GmbH & Co KG vendor imple-
469 mentation recognizes `CUSTOM` as a `CCOpType`. For such operations, the
470 `fieldspec` must be omitted and the data string in the `CCOpDataSpec` must be
471 defined using the `bits` datatype and `hex` format. The data returned in the
472 `CCOpReport` will also be formatted using the `bits` datatype and `hex` format.

473 This operation essentially sends binary data to the reader, which in return
474 answers with binary data. The specific binary data to send to the reader
475 depends on the model of the reader and the tag used.

476 **6.1.1.2 CHECK Operation**

477 The HARTING IT Software Development GmbH & Co KG vendor imple-
478 mentation recognizes the values `epcBank` and `userBank` as valid `fieldspec`
479 values for the `CHECK` `CCOpType` as defined in section 9.3.5.1 of the ALE
480 specification document.

481 This ALE implementation supports the ISO 15962 standard in Data Format
482 9, for all other formats the `CHECK` operation will result in a `CCOpStatus` of
483 `OP_NOT_POSSIBLE_ERROR`.

484 **6.1.1.3 INITIALIZE Operation**

485 The HARTING IT Software Development GmbH & Co KG vendor imple-
486 mentation recognizes the values `epcBank` and `userBank` as valid `fieldspec`
487 values for the `INITIALIZE` `CCOpType` as defined in section 9.3.5.2 of the ALE
488 specification document.

489 This ALE implementation supports the ISO 15962 standard in Data Format
490 9, for all other formats the INITIALIZE operation will raise the "opera-
491 tion not possible" condition and this always results in a CCOpStatus of
492 OP_NOT_POSSIBLE_ERROR.

493 **6.1.2 CCStatProfileName**

494 Each valid value of CCStatProfileName names as statistics profile that can
495 be included in a CCReports.

	<<Enumerated Type>> CCStatProfileName
496	TagTimestamps
497	TagCount
498	ReaderNames
499	ReaderSightingSignals
500	<<extension point>>

501 **6.2 CCReports**

502 See Section 9.4 of the ALE specification document.

503 **6.2.1 CCTagTimestampStat**

504 CCTagTimestampStat is a subclass of CCTagStat. The HARTING IT Soft-
505 ware Development GmbH & Co KG vendor implementation includes one
506 CCTagTimestampStat in a CCTagReport if the TagTimestamps statistics pro-
507 file was included in the corresponding CCCmdSpec. CCTagTimestampStat
508 includes all of the fields in CCTagStat, plus the following additional fields:

	CCTagTimestampStat
509	firstSightingTime : dateTime
510	lastSightingTime : dateTime
511	---

512 This ALE implementation constructs a CCTagTimestampStat as follows:

Field	Type	Description
profile	CCStatProfileName	This field contains the EventTimestamp value of CCStatProfileName.
statBlock	List <ECReaderStat>	This field contains an empty list.

firstSightingTime	dateTime	This field contains the first time within this command cycle that the tag was seen by any reader contributing to this command cycle.
lastSightingTime	dateTime	This field contains the last time within this command cycle that the tag was seen by any reader contributing to this command cycle.

Table 10: CCTagTimestampStat Fields

6.2.2 CCTagCountStat

CCTagCountStat is a subclass of CCTagStat. The HARTING IT Software Development GmbH & Co KG vendor implementation includes one CCTagCountStat in a CCTagReport if the TagCount statistics profile was included in the corresponding CCCmdSpec. CCTagCountStat includes all of the fields in CCTagStat, plus the following additional fields

CCTagCountStat	
count	: int

This ALE implementation constructs a CCTagCountStat as follows:

Field	Type	Description
profile	CCStatProfileName	This field contains the TagCount value of CCStatProfileName.
statBlock	List <ECReaderStat>	This field contains an empty list.
Count	int	This field contains the count how often this tag was seen within this command cycle by any reader contributing to this command cycle.

Table 11: CCTagCountStat Fields

523 **6.3 Random Number Generator**

524 This HARTING IT Software Development GmbH & Co KG vendor imple-
525 mentation interprets an RNGSpec as specified in section 9.7.2 of the ALE
526 specification document. This ALE implementation does not define exten-
527 sions to that class in order to provide additional parameters to control the
528 behavior of a random number generator.

529 **7 ALE Logical Reader API**

530 **7.1 API**

531 See section 10.3 of the ALE specification document.

532 The HARTING IT Software Development GmbH & Co KG vendor implemen-
533 tation does not support to change the definition of a logical reader that
534 is used by an ECSpec, CCSpec or PCSpec that is active at the time the
535 change is requested. Therefore the `update`, `addReaders`, `setReaders`,
536 `removeReaders`, and `setProperties` methods will raise an `InUseException`
537 any time a client calls these methods for a logical reader that is in use by an
538 active ECSpec, CCSpec or PCSpec. An `ImmutableReaderException` will be
539 raised when trying to update, undefine or change properties of the Built-In
540 reader (see 7.3.3.4).

541 **7.2 LRSpec**

542 See section 10.4 of the ALE specification document.

543 In addition the HARTING IT Software Development GmbH & Co KG vendor
544 implementation supports API-defined Base Reader for logical readers see
545 section 7.3. The implementation will therefore not raise a
546 `ValidationException` if the `isComposite` parameter is false.

547 **7.3 API-defined Base Reader**

548 The HARTING IT Software Development GmbH & Co KG vendor imple-
549 mentation supports a mechanism to define a new base reader using the
550 `define` method of the Logical Reader API. This ALE implementation uses
551 the `properties` parameter of an LRSpec to forward information about the
552 communication with a physical reader to the ALE.

553 Therefore the implementation specifies vendor specific properties and or-
554 ganized these properties in namespaces as specified in the below table.

555 In the following descriptions the term "Connector" refers to a unit to exe-
556 cute the communication with a physical reader and to provide an abstract
557 interface to interact with this unit. For each type of physical reader a differ-
558 ent "Connector" unit is used for interaction but every "Connector" provides
559 the same interface. The term "Controller" refers to a unit to manage the
560 interaction between the ALE and one "Connector" unit and thereby to the
561 physical reader.

Property Namespace	Description
	If namespace is omitted this means the common namespace is used which indicates that the property is recognized and handled by the Logical Reader API itself (i.e. tag smoothing parameter see section 7.4).
Controller.	The Controller namespace indicates that the property is recognized and handled by the "Controller" unit.
Connector.	The Connector namespace indicates that the property is recognized and handled by the "Connector" unit.
Reader.	The Reader namespace indicates that the property is recognized and handled also by the "Connector" unit, but this namespace is reserved for specific "Connector" type properties defined by each "Connector" type.

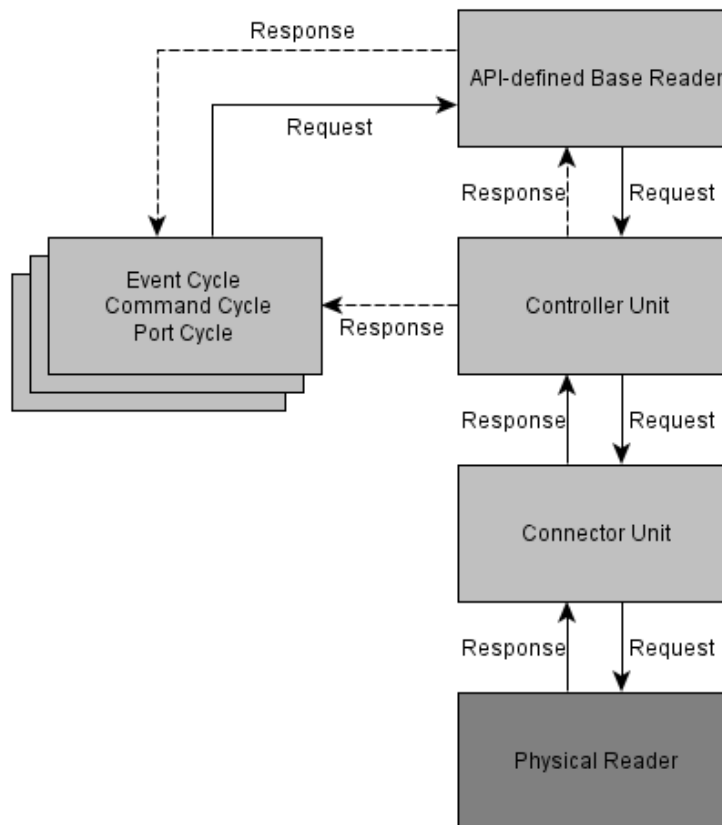

Table 12: Reader Property Namespaces

The `define`, `update` and `setProperty` methods of the Logical Reader API will raise a `ValidationException` under any of the following circumstances:

- A property `name` within the common namespace is not recognized by the implementation.
- A property `name` with specified namespace is within a namespace that is not recognized by the implementation
- The value specified for a property is not legal value for that property.
- The specified `name` is the same as a `name` of another `LRProperty` within the same `LRSpec`.

This ALE implementation will use one "Controller" unit for every base reader defined using the `define` method of the Logical Reader API and one "Connector" unit for each "Controller".

576 The following picture shows non-normative the integration of these units in
577 the ALE:

578 Figure 1: API-defined Base Reader Interaction

579 The picture shows the interaction between event, command, port cycle
580 instances and an API-defined Base Reader using "Controller" and "Connec-
581 tor" units for communication to a physical reader. While the diagram shows
582 two different ways for the "Controller" unit to deliver a response, the deci-
583 sion if the "Controller" sends its response directly to the cycle or bypass it
584 over the logical reader is made by the logical reader instance. If the logical
585 reader instance has to handle the response like when tag smoothing is
586 activated (see section 7.4) the response will be passed through the logical
587 reader otherwise the response will be delivered directly.

588 This ALE implementation recognizes the properties for each namespace as
589 defined in the following four sub-sections.

590 7.3.1 Common Namespace

591 The HARTING IT Software Development GmbH & Co KG vendor implemen-
592 tation recognizes a set of `LRProperty` parameters, which an ALE client
593 set using the `properties` parameter of an `LRSpec` or the `setProperties`
594 method of the Logical Reader API for the common namespace. This ALE
595 implementation interprets these parameters as follows:

Property Name	Description
ReaderType	A string that refers to the type of "Connector" unit which is used to interact with the specific physical reader.
GlimpsedTimeout	(Optional) A tag smoothing property, see section 7.4 of this document and section 10.6 of the ALE specification document.
ObservedTimeThreshold	(Optional) A tag smoothing property, see section 7.4 of this document and section 10.6 of the ALE specification document.
ObservedCountThreshold	(Optional) A tag smoothing property, see section 7.4 of this document and section 10.6 of the ALE specification document.
LostTimeout	(Optional) A tag smoothing property, see section 7.4 of this document and section 10.6 of the ALE specification document.
AntennaID	(Optional) An antenna restriction property, see section 7.5.

Table 13: Common Namespace Properties

The `define`, `update` and `setProperties` methods of the Logical Reader API will raise a `ValidationException` under any of the following circumstances:

- If the `isComposite` parameter within the `LRSpec` is true and `ReaderType` property is specified.
- If the `isComposite` parameter within the `LRSpec` is false and `ReaderType` property is null, omitted or has a value that is not known to the implementation.

7.3.2 Controller Namespace

The HARTING IT Software Development GmbH & Co KG vendor implementation recognizes a set of `LRProperty` parameters, which an ALE client set using the `properties` parameter of an `LRSpec` or the `setProperties` method of the Logical Reader API for the controller namespace. This ALE implementation interprets these parameters as follows:

Property Name	Description
<code>Controller.Timeout</code>	(Optional) A timespan, in milliseconds that governs the timespan after which no response from a "Connector" unit results in a timeout. Note that a too-small value for <code>Controller.Timeout</code> including zero value will cause the "Controller" to achieve the timeout condition immediately
<code>Controller.ReconnectDelay</code>	(Optional) A timespan, in milliseconds that defines the delay before a reconnect will be attempted after the connection to the reader has been lost. The default value is 2000.
<code>Controller.OptimizeWriteOperations</code>	(Optional) A boolean that defines whether writing operations in the ALE Writing API will be optimized. When <code>true</code> , operations defined inside a <code>CCCmdSpec</code> , writing to the same blocks, on the same memory bank, will be optimized to only write once, to reduce the workload of the reader. The default value is <code>true</code> .

Table 14: Controller Namespace Properties

The `define`, `update` and `setProperty` methods of the Logical Reader API will raise a `ValidationException` under any of the following circumstances:

- If the `isComposite` parameter within the `LRSpec` is `true` and any property of the controller namespace is specified.
- If the value of the `Controller.Timeout` property is a non-null string that is not parseable as a non-negative decimal numeral.
- If the value of the `Controller.ReconnectDelay` property is a non-null string that is not parseable as a non-negative decimal numeral.
- If the value of the `Controller.OptimizeWriteOperations` property is a non-null string that is not parseable as `true` or `false`.

7.3.3 Connector Namespace

The HARTING IT Software Development GmbH & Co KG vendor implementation recognizes a set of `LRProperty` parameters, which an ALE client set using the `properties` parameter of an `LRSpec` or the `setProperty` method of the Logical Reader API for the connector namespace. This ALE implementation interprets these parameters as follows:

Property Name	Description
<code>Connector.ConnectionType</code>	A string that refers to the type of connection used by the "Connector" unit to interact with the physical reader (i.e. TCP).
<code>Connector.Host</code>	(Optional) A string that refers to the DNS name or IP address of the physical reader.
<code>Connector.Port</code>	(Optional) An unsigned integer that refers to the TCP or COMM port of the physical reader.
<code>Connector.DeviceID</code>	(Optional) An unsigned integer that refers to the device ID of the physical reader for USB connection. If <code>Connector.DeviceID</code> property is zero the connector will select randomly one available USB reader.
<code>Connector.Timeout</code>	(Optional) A timespan, in milliseconds that governs the timespan after which no response from a physical reader results in a timeout. Note that a too-small value for <code>Connector.Timeout</code> including zero value will cause the "Connector" to achieve the timeout condition immediately.

Table 15: Connector Namespace Properties

7.3.3.1 ConnectionType

`ConnectionType` is an enumerated property denoting what type of connections is used for communication with a physical reader.

<<Enumerated Type>>	
<code>ConnectionType</code>	
<code>TCP</code>	//Indicates a communication via network using TCP protocol
<code>USB</code>	//Indicates a communication via USB port
<code>COMM</code>	//Indicates a communication via COMM port

The `define`, `update` and `setProperties` methods of the Logical Reader API will raise a `ValidationException` under any of the following circumstances:

- If the `isComposite` parameter within the `LRSpec` is true and any property of the connector namespace is specified.
- If the `Connector.ConnectionType` property is null, omitted or has a value that is not known to the implementation.
- If the value of `Connector.ConnectionType` property is `TCP` and both `Connector.Host` and `Connector.IP` property are omitted or `Connector.Port` property is omitted.
- If the value of `Connector.ConnectionType` property is `USB` and `Connector.DeviceID` property is omitted.

- If the value of `Connector.ConnectionType` property is `COMM` and `Connector.Port` is omitted.
- If the value of `Connector.Host` property is a non-null string that is not valid DNS name nor parseable as an IP-Address of the form `[1-255].[1-255].[1-255].[1-255]`.
- If the value of `Connector.IP` property is a non-null string that is not parseable as an IP-Address of the form `[1-255].[1-255].[1-255].[1-255]`.
- If the value of `Connector.Port` property is a non-null string that is not parseable as a non-negative decimal numeral.
- If the value of `Connector.Timeout` property is a non-null string that is not parseable as a non-negative decimal numeral.

Besides the default properties within the connector namespace each "Connector" implementation can define a set with additional properties in the connector namespace that are only interpreted by this specific "Connector". The following sub section will describe these additional properties for the given reader connector implementations.

7.3.3.2 LLRP Connector

The HARTING IT Software Development GmbH & Co KG vendor implementation provides support for physical readers that support the Low Level Reader Protocol (LLRP) for the communication between clients and the reader. The ALE implementation provides an LLRP connector implementation to handle the communication between the ALE and these readers based on LLRP. This connector type can be initialized, with the `LRProperty` parameter `ReaderType` with the value `LLRP`, using the `properties` parameter of an `LRSpec` or the `setProperties` method of the Logical Reader API.

LLRP Type	ReaderType Property Value	Description
LLRP	"LLRP"	Operate on a physical reader of type LLRP within the Host mode.

Table 16: LLRP Connector Types

The LLRP Connector recognizes an additional set of `LRProperty` parameters within the connector namespace, and interprets these parameters as follows:

Property Name	Description
<code>Connector.Keepalive</code>	(Optional) A timespan, in milliseconds that governs the timespan after which no communication between the physical reader and the connector will cause the connector to send a keepalive message. Note the default value for <code>Connector.Keepalive</code> is 30000 milliseconds.
<code>Connector.InventoryAttempts</code>	(Optional) An unsigned integer that specifies the amount of inventories that are performed to acquire a specific tag to execute operation, defined through CC, on. Note the default value for <code>Connector.InventoryAttempts</code> is 3.

Table 17: LLRP Connector Properties

7.3.3.3 RF-R Connector

The HARTING IT Software Development GmbH & Co KG vendor implementation provides support for all physical readers of the type HARTING RF-R. The ALE implementation provides connector implementations to handle the communication between the ALE and all supported RF-R readers. These connector types can be initialized according to the following table, using the properties parameter of an `LRSpec` or the `setProperties` method of the Logical Reader API.

RF-R Type	ReaderType Property Value	Description
RF-R500	"RF-R500"	Operate on a physical reader of type RF-R500 within the Host mode.

Table 18: RF-R Connector Types

The RF-R Connector recognizes an additional set of `LRProperty` parameters within the connector namespace, and interprets these parameters as follows:

Property Name	Description
<code>Connector.Inventory.Antennas</code>	<p>(Optional) A byte value that specifies which antenna ports are used for inventory attempts for this physical reader.</p> <p>Value = 1 → Antenna No 1 Value = 2 → Antenna No 2 Value = 4 → Antenna No 3 Value = 8 → Antenna No 4</p> <p>Also every combination of these values by addition of single values is possible. For example: Value = 9 → Antenna No 1, 4</p>

<code>Connector.InventoryAttempts</code>	(Optional) An unsigned integer that specifies the amount of inventories that are performed to acquire a specific tag to execute operation, defined through CC, on. Note the default value for <code>Connector.InventoryAttempts</code> is 3.
<code>Connector.TagsInField</code>	(Optional) An unsigned integer that specifies the maximum quantity of tags within the reader field at the same time. Note the default value for <code>Connector.TagsInField</code> is 128.
<code>Connector.BlockSize</code>	(Optional) An unsigned integer that specifies the byte size of a block within a tag. Note the default value for <code>Connector.BlockSize</code> is 2.
<code>Connector.BlockCount</code>	(Optional) An unsigned integer that specifies the number of blocks within a tag. Note the default value for <code>Connector.BlockCount</code> is 256.
<code>Connector.ReaderErrorCount</code>	(Optional) An unsigned integer that specifies the amount of inventories without reader error before the error is logged again. Note the default value for <code>Connector.ReaderErrorCount</code> is 3.
<code>Connector.MaxNoOfDataBlocksRead</code>	(Optional) An unsigned integer that specifies the maximum number of blocks that will be read during an inventory at once. Note the default value for <code>Connector.MaxNoOfDataBlocksRead</code> is 128.
<code>Connector.IsoErrorCount</code>	(Optional) An unsigned integer that specifies the amount of inventories without iso error before the error is logged again. Note the default value for <code>Connector.IsoErrorCount</code> is 3.
<code>Connector.AntennaErrorCount</code>	(Optional) An unsigned integer that specifies the amount of inventories without antenna error before the error is logged again. Note the default value for <code>Connector.AntennaErrorCount</code> is 3.

Table 19: RF-R500 Connector Properties

7.3.3.4 Built-In Connector

The HARTING IT Software Development GmbH & Co KG vendor implementation provides support for the built-in reader of the RFID Reader RF-R350. The ALE implementation provides a connector implementation to handle the communication between the ALE and the built-in reader. The ALE automatically detects the built-in reader and predefines the necessary `LRSpec`

698 with the name `BuiltIn`. Both `getLogicalReaderNames` and `getLRSpec` will
699 include the built-in reader.

700 The Built-In Connector currently supports no `LRProperty` parameters.

701 **7.3.4 Reader Namespace**

702 The HARTING IT Software Development GmbH & Co KG vendor implemen-
703 tation recognizes a set of `LRProperty` parameters, which an ALE client
704 set using the `properties` parameter of an `LRSpec` or the `setProperties`
705 method of the Logical Reader API for the reader namespace.

706 Properties within the reader namespace are "Reader" specific properties.
707 Therefore each "Reader" type defines its own set of properties recognized
708 within the reader namespace. These properties are used to configure the
709 physical reader, each connector provides all configuration properties that
710 are supported by the physical reader the specific connector was imple-
711 mented for.

712 The `define`, `update` and `setProperties` methods of the Logical Reader
713 API will raise a `ValidationException` under any of the following circum-
714 stances:

- 715 • If the `isComposite` parameter within the `LRSpec` is true and any
716 property of the reader namespace is specified.
- 717 • If the value of any property is a non-null string that is not parseable
718 into the expected type.

719 **7.4 Tag Smoothing**

720 The HARTING IT Software Development GmbH & Co KG vendor implemen-
721 tation does fully support tag smoothing as specified in section 10.6 of the
722 ALE specification document for EC, CC and the PC API. Therefore this ALE
723 implementation will not raise a `ValidationException` when a client sets
724 the tag smoothing properties.

725 **7.5 Antenna Restriction**

726 Antenna restriction is a mechanism whereby a composite reader can be
727 configured to use only a single antenna from a single base reader within its
728 readers list to acquire tags. Thereby a logical reader will consider at any
729 point in time a tag to be within view if the tag was read on the specified
730 antenna of the base reader. Only the acquiring of tags underlies these
731 restriction, consequently after a command cycle acquired a matching tag it
732 will operated on this tag regardless which antenna the physical reader uses
733 to execute the operation. Antenna restriction is based upon one parameter,
734 which an ALE client set using the `properties` parameter of an `LRSpec`
735 or the `setProperties` method of the Logical Reader API, as specified in
736 section 10.3 of the ALE specification document. This ALE implementation
737 interprets this parameter as follows:

Property Name	Description
AntennaID	An unsigned integer that specifies the id of the antenna to use for acquiring tags through the logical reader. If a tag is in view of the specified antenna of its reader within the readers list, the logical reader will forward this tag to its observers (event cycle, command cycle, port cycle or another composite reader). Note that an <code>AntennaID</code> of zero or greater value than the number of antennas of the physical reader will result in the behavior that the reader will never forward a tag because no tag will ever match the requirements set by <code>AntennaID</code> .

Table 20: Antenna Restriction Properties

If the property is set to null for a given logical reader the implementation will not use antenna restriction for that logical reader. The `define`, `update` and `setProperties` methods of the Logical Reader API will raise a `ValidationException` under any of the following circumstances:

- If the `isComposite` parameter within the `LRSpec` is false and the `AntennaID` property is specified.
- If the `isComposite` parameter within the `LRSpec` is true, the `AntennaID` property is specified and the reader list contains more than one base reader.
- If the `isComposite` parameter within the `LRSpec` is true, the `AntennaID` property is specified and the `readers` list contains a composite reader.
- If the value of the `AntennaID` property is a non-null string that is not parseable as a non-negative decimal integer numeral.

8 Access Control API

The HARTING IT Software Development GmbH & Co KG vendor implementation does not support the ALE Access Control API specified in section 11 of the ALE specification document.

9 ALE Digital Input and Output API

This section defines normatively the ALE Digital Input and Output API. The external interface is defined by the ALEPC interface (Section 9.1). This interface makes use of a number of complex data types that are documented in the sections following section 9.1. The specification of the Digital Input and Output API follows the general rules given in Section 4 of the ALE specification document.

Through the ALEPC interface defined in section 9.1, clients may define and manage port cycle specification (PCSpecs), operate upon ports on-demand by activating PCSpecs synchronously, and enter standing request (subscriptions) for PCSpecs to be activated asynchronously. Results from standing

767 requests are delivered through the ALEPCCallback interface, specified in
768 section 9.4.

769 **9.1 ALEPC - Main API Class**

<<interface>>
ALEPC

770 ---
771 define(specName : String, spec : PCSpec) : void
772 undefine(specName : String) : void
773 getPCSpec(specName : String) : PCSpec
774 getPCSpecNames() : List<String>
775 subscribe(specName : String, notificationURI : String) : void
776 unsubscribe(specName : String, notificationURI : String) : void
777 poll(specName : String) : PCReports
778 immediate(spec : PCSpec) : PCReports
779 getSubscribers(specName : String) : List<String>
780 execute(specs :PCOpSpecs) :PCOpReports
781 getStandardVersion() : String
782 getVendorVersion() : String
783 <<extension point>>

784 This ALE implementation implements the methods of the ALE Digital Input
785 and Output API as specified in the following table:

Method	Argument /Result	Type	Description
define	specname	String	Creates a new PCSpec having the name specName, according to spec.
	spec	PCSpec	
	[result]	Void	
undefine	specname	String	Removes the PCSpec named specName that was previously created by the define method.
	[result]	Void	
getPCSpec	specname	String	Returns the PCSpec that was provided when PCSpec named specName was created by the define method.
	[result]	PCSpec	

getPCSpecNames	[result]	List <String>	Returns an unordered list of the names of all PCSpec that are visible to the caller.
subscribe	specname	String	Adds a subscriber having the specified notificationURI to the set of current subscribers of the PCSpec named specName. The notificationURI parameter both identifies a specific binding of the ALEPCCallback interface and specifies addressing information meaningful to that binding.
	notificationURI	String	
	[result]	Void	
unsubscribe	specname	String	Removes a subscriber having the specified notificationURI from the set of current subscribers of the PCSpec named specName.
	notificationURI	String	
	[result]	Void	
poll	specname	String	Request an activation of the PCSpec named specName, returning the results form the next port cycle to complete.
	[result]	PCReports	
immediate	spec	PCSpec	Creates an unnamed PCSpec according to spec, and immediately requests its activation.
	[result]	PCReports	
getSubscribers	specName	String	Returns an unordered, possibly empty list of the notification URIs corresponding to each of the current subscribers for the PCSpec named specName.
	[result]	List <String>	
execute	specs	PCOpSpecs	Executes a list of PCOpSpec according to specs, and returning the corresponding list of PCOpReport.
	[result]	PCOpReports	
getStandardVersion	[result]	String	Returns a string that identifies what version of the specification this implementation of the Digital Input and Output API complies with.
getVendorVersion	[result]	String	Returns a string that identifies what vendor extensions this implementation of the Digital Input and Output API provides.

787 The primary data type associated with the ALE Digital Input and Output API
 788 are the `PCSpec`, which specifies how a port cycle is to be carried out, and
 789 the `PCReports`, which contains one or more reports generated from one
 790 activation of a `PCSpec`.
 791 `PCReports` instance are both returned from the `poll` and the `immediate`
 792 methods, and also sent to subscribers when `PCSpecs` are subscribed to
 793 using the `subscribe` method. The next two sections, Section 9.2 and
 794 Section 9.3, specify the `PCSpec` and `PCReports` data types in full detail.

795 9.1.1 Error Conditions

796 Methods of the ALE Digital Input and Output API signal error conditions to
 797 the client by means of exceptions. The following exceptions are defined.
 798 All the exception types in the following table are extensions of a common
 799 `ALEException` base type, which contains one string element giving the
 800 reason for the exception.

Exception Name	Meaning
<code>SecurityException</code>	The operation was not permitted due to an access control violation or other security concern.
<code>DuplicateNameException</code>	The specified <code>PCSpec</code> name already exists.
<code>PCSpecValidationException</code>	The specified <code>PCSpec</code> is invalid. The complete list of rules for generating this exception is specified in Section 4.2.14.
<code>InvalidURIException</code>	The URI specified for a subscriber does not conform to URI syntax as specified in [RFC2396], does not name a binding of the <code>ALEPCCallback</code> interface recognized by the implementation, or violates syntax or other rules imposed by a particular binding.
<code>NoSuchNameException</code>	The specified <code>PSSpec</code> name does not exist.
<code>NoSuchSubscriberException</code>	The specified subscriber does not exist.
<code>DuplicateSubscriberException</code>	The specified <code>PCSpec</code> name and subscriber URI is identical to a previous subscription that was created and not yet unsubscribed.
<code>ImplementationException</code>	A generic exception raised by the implementation for reasons that are implementation-specific. This exception contains one additional element: a <code>severity</code> member whose values are either <code>ERROR</code> or <code>SEVERE</code> . <code>ERROR</code> indicates that the ALE implementation is left in the same state it had before the operation was attempted. <code>SEVERE</code> indicates that the ALE implementation is left in an indeterminate state.

801 Table 22: Exceptions in the ALEPC Interface

802 The exceptions that may be raised by each ALE method are indicated in

803 the table below. This ALE implementation raises the appropriate exception
804 listed below when the corresponding condition described above occurs. If
805 more than one exception condition applies to a given method call, the
806 implementation may raise any of the exceptions that applies.

ALE Method	Exceptions
define	DuplicateNameException PCSpecValidationException SecurityException ImplementationException
undefine	NoSuchNameException SecurityException ImplementationException
getPCSpec	NoSuchNameException SecurityException ImplementationException
getECSpecNames	SecurityException ImplementationException
subscribe	NoSuchNameException InvalidURIException DuplicateSubscriberException SecurityException ImplementationException
unsubscribe	NoSuchNameException NoSuchSubscriberException InvalidURIException SecurityException ImplementationException
poll	NoSuchNameException SecurityException ImplementationException
immediate	PCSpecValidationException SecurityException ImplementationException
getSubscribers	NoSuchNameException SecurityException ImplementationException
execute	PCSpecValidationException SecurityException ImplementationException
getStandardVersion	ImplementationException
getVendorVersion	ImplementationException

807 Table 23: Exceptions Raised by each ALEPC Interface Method

808 **9.2 PCSpec**

809 A `PCSpec` is a complex type that describes a port cycle. A port cycle is an
810 interval of time during which ports are operated upon.

811 A `PCSpec` contains

- 812 (a) one or more logical reader names;
- 813 (b) a boundary specification (`PCBoundarySpec`) that identifies an interval
814 of time;
- 815 (c) one or more reports specification (`PCReportSpec`) that specify opera-
816 tions to be performed on ports of any specified logical readers during
817 the specified interval of time.

818 The report specification also implies what information is included in a report
819 generated from each port cycle generated from this `PCSpec`.

	PCSpec
820	<code>logicalReader : List<String></code>
821	<code>boundarySpec : PCBoundarySpec</code>
822	<code>reportSpecs : List<PCReportSpec></code>
823	<code>includeSpecInReports : Boolean</code>
824	<code><<extension point>></code>
825	<code>---</code>

826 This ALE implementation interprets the fields of a `PCSpec` as follows:

Field	Type	Description
<code>logicalReader</code>	<code>List<String></code>	An unordered list that specifies one or more logical readers that are used to receive tag events that causes port operations to be processed.
<code>boundarySpec</code>	<code>PCBoundarySpec</code>	Specifies the starting and stopping conditions for port cycles. See Section 9.2.1
<code>reportSpecs</code>	<code>List<PCReportSpec></code>	An ordered list that specifies one or more reports with sequences of operations to apply to ports. See Section 9.2.3
<code>includeSpecInReports</code>	<code>Boolean</code>	If true, specifies that each <code>PCReports</code> instance generated from this <code>PCSpec</code> includes a copy of the <code>PCSpec</code> . If false, each <code>PCReports</code> instance not includes a copy of the <code>PCSpec</code> .

827

Table 24: PCSpec Fields

828 The `define` and immediate methods raise a `PCSpecValidationException`
829 if any of the following are true for a `PCSpec` instance:

- 830 • The `logicalReaders` parameter contains any logical reader names that
831 are not known to the implementation.
- 832 • The `boundarySpec` parameter is null or omitted, or the specified
833 `boundarySpec` leads to a `PCSpecValidationException` as specified in
834 Section 9.2.1
- 835 • The `reportSpecs` parameter is null, omitted, empty, or any of the
836 members of `reportSpecs` leads to a `PCSpecValidationException` as
837 specified in Section 9.2.3

838 **9.2.1 PCBoundarySpec**

839 A `PCBoundarySpec` specifies how the beginning and end of port cycles are
840 to be determined.

	PCBoundarySpec
841	<code>startTriggerList : List<ECTrigger></code>
842	<code>repeatPeriod : ECTime</code>
843	<code>stopTriggerList : List<ECTrigger></code>
844	<code>duration : ECTime</code>
845	<code>noNewEventsInterval : ECTime</code>
846	<code>whenDataAvailable : Boolean</code>
847	<code><<extension point>></code>
848	<code>---</code>

849 This ALE implementation interprets the fields of a `PCBoundarySpec` as
850 follows:

Field	Type	Description
<code>startTriggerList</code>	<code>List<ECTrigger></code>	(Optional) An unordered list that specifies zero or more triggers that may start a new port cycle for this <code>PCSpec</code> .
<code>repeatPeriod</code>	<code>ECTime</code>	(Optional) Specifies an interval of time for starting a new port cycle for this <code>PCSpec</code> , relative to the start of the previous port cycle.
<code>stopTriggerList</code>	<code>List<ECTrigger></code>	(Optional) An unordered list that specifies zero or more triggers that may stop a port cycle for this <code>PCSpec</code> .

Duration	ECTime	(Optional) Specifies an interval of time for stopping a port cycle for this <code>PCSpec</code> , relative to the start of the port cycle. If omitted or equal to zero, has no effect on the stopping of the port cycle.
noNewEventsInterval	ECTime	(Optional) Specifies that a port cycle be stopped if no new events are raised within the specified interval. If omitted or equal to zero, has no effect on the stopping of the port cycle.
whenDataAvailable	Boolean	(Optional) If true, specifies that a port cycle be stopped when any event raises that matches the conditions, filter or trigger, of at least one <code>PCReportSpec</code> within this <code>PCSpec</code> . If omitted or false, has no effect on the stopping of the port cycle.

Table 25: `PCBoundarySpec` Fields

851

852 The `define` and `immediate` methods raise a `PCSpecValidationException`
853 if any of the following are true for a `PCBoundarySpec` instance:

- 854 • A negative number is specified for any of the `ECTime` values `duration`,
855 `repeatPeriod`, and `noNewEventsInterval`.
- 856 • Any element of `startTriggerList` or `stopTriggerList` does not con-
857 form to URI syntax as defined by [RFC2396], or is a URI that is not
858 supported by the ALE implementation. Note that an empty string does
859 not conform to URI syntax as defined by [RFC2396].
- 860 • No stopping condition is specified: i.e., `stopTriggerList` is empty,
861 `duration` is zero or omitted, `noNewEventsInterval` is zero or omitted
862 and `whenDataAvailable` is false.

863 In the description below, the phrase “if specified” used in reference to
864 `repeatPeriod`, `duration` or `noNewEventsInterval` means that the pa-
865 rameter is specified and is positive (non-zero) number.

866 The `boundarySpec` parameter of `PCSpec` (of type `PCBoundarySpec`) speci-
867 fies starting and stopping conditions as referred to in the `PCSpec` lifecycle
868 specified in Section 3.3.

869 Within that description, “arrival of a start trigger” means that the ALE imple-
870 mentation receives any of the triggers specified in the `startTriggerList`
871 for this `PCSpec`, and “repeat period” means the value if the `repeatPeriod`
872 parameter, if specified. The phrase “a stopping condition occurred” means
873 the first of the following to occur:

- 874 • The `duration`, when specified, expires (measured from the start of the
875 port cycle).
- 876 • When the `noNewEventsInterval` is specified, no new Events are raised
877 by any reader for the specified interval.

- Any one of the stop triggers specified in the `stopTriggerList` received.
- The `whenDataAvailable` parameter is true, and any event occurred that matches the filter or trigger condition of at least one `PCReportSpec` within this `PCSpec`. If several matching events are raised in a single reader cycle, the implementation terminate the port cycle after receiving all of those events.

9.2.2 ECTime

See section 8.2.2 of the ALE specification document.

9.2.3 PCReportSpec

A `PCReportSpec` includes (a) a filter specification (`PCFilterSpec`) that has inclusive/exclusive filters to select an amount of tags; (b) a trigger list that defines a list of triggers (`ECTrigger`); (c) an ordered list of one or more operation specifications (`PCOpSpec`), each of which describes a single operation to be performed on a port. During a port cycle, the ALE implementation attempts to carry out the commands specified by the operation specifications on the specified ports.

	PCReportSpec
894	<code>name : String</code>
895	<code>filterSpec : PCFilterSpec</code>
896	<code>triggerList: List<ECTrigger></code>
897	<code>opSpecs : List<PCOpSpec></code>
898	<code>reportIfEmpty : Boolean</code>
899	<code>statProfileNames : List<PCStatProfileName></code>
900	<code><<extension point>></code>
901	<code>---</code>

This ALE implementation interprets the fields of a `PCReportSpec` as follows:

Field	Type	Description
name	String	Specifies a name for reports generated from this <code>PCReportSpec</code> . The ALE implementation copies this name into the <code>PCReport</code> instance generated from this <code>PCReportSpec</code> .
filterSpec	PCFilterSpec	Specifies how tags are filtered before the event to cause the operations to be processed is raised as specified in Section 9.2.4

triggerList	List<ECTrigger>	Specifies the trigger that can cause the operations to be processed, as specified in Section 5.1.1.
opSpecs	List<PCOpSpec>	An ordered list of PCOpSpec instances, each specifying an operation to be carried out on a port, as specified in Section 9.2.5. This ALE implementation will process each event that matches filterSpec or triggerList acquired during a port cycle.
reportIfEmpty	Boolean	Specifies whether to omit the PCReport instance if the final set of ports is empty, as specified below.
statProfileNames	List <PCStatProfileName>	An ordered list that specifies zero or more statistics profiles that govern what statistics are to be included in the report, as specified in Section 9.2.9.

Table 26: PCReportSpec Fields

The `define` and `immediate` methods raise a `PCSpecValidationException` if any of the following are true for a `PCReportSpec` instance:

- The specified name is an empty string or is not accepted by the implementation according to Section 4.5 of the ALE specification document.
- The specified name is a duplicate of another report name in the same `PCSpec`.
- The specified `filterSpec` leads to a `PCSpecValidationException` as specified in Section 9.2.4.
- The value of any element of `triggerList` does not conform to URI syntax as defined by [RFC2396], or is a URI that is not supported by the ALE implementation. Note that an empty string does not conform to URI syntax as defined by [RFC2396].
- Both `filterSpec` and `triggerList` are specified for the same `PCReportSpec`.
- The `logicalReaders` parameter of `PCSpec` is null, omitted or an empty list and `triggerList` is not specified.
- Any element of `opSpecs` leads to a `PCSpecValidationException` as specified in Section 9.2.5.
- Any element of `statProfileNames` is not the name of a known statistic profile.
- If `triggerList` is specified and any element of `statProfileNames` refers to a tag statistic which is not evaluable by a trigger event.

926 *Note if both `filter` and `trigger` are not specified for a report this is*
927 *equivalent to an empty filter list where every tag event will match the filter*
928 *conditions. An empty list will be interpreted by the ALE implementation as*
929 *not specified.*

930 A `PCReports` instance includes a `PCReport` instance corresponding to each
931 `PCReportSpec` in the governing `PCSpec`, in the same order specified in the
932 `PCSpec`, except that a `PCReport` instance is omitted under the following
933 circumstances:

- 934 • If a `PCReportSpec` has `reportIfEmpty` set to false, then the corre-
935 sponding `PCReport` instance is omitted from the `PCReports` for this
936 port cycle if the final, filtered set of events is empty.

937 When the processing of `reportIfEmpty` results in *all* `PCReport` instances
938 being omitted from the `PCReports` for a port cycle, then the delivery of the
939 results to subscribers is suppressed altogether. That is, a result consisting
940 of a `PCReports` having zero contained `PCReport` instances is not sent to
941 a subscriber. This rule only applies to subscribers, a `PCReports` instance
942 always is returned to the caller of `immediate` or `poll` at the end of a port
943 cycle, even if the `PCReports` instance contains zero `PCReport` instances.

944 The `statProfileName` parameter is a list of `PCStatProfileName`, each of
945 which corresponds to a statistics profile that will be included in the
946 `PCReports`. If the ALE engine does not recognize any name in the list or
947 the combination of event set (trigger or tags) and any statistics profile is
948 not evaluable it raises a `PCSpecValidationException`.

949 9.2.4 PCFilterSpec

950 A `PCFilterSpec` specifies what tags will cause port operations to be pro-
951 cessed by a `PCReportSpec`.

PCFilterSpec	
952	<code>filterList : List<ECFilterListMember></code>
953	<code><<extension point>></code>
954	<code>---</code>

955 This ALE implementation interprets the fields of a `PCFilterSpec` as follows.

Field	Type	Description
<code>filterList</code>	<code>List <ECFilterListMember></code>	Specifies an unordered list of filters, as specified below.

956 Table 27: `PCFilterSpec` Fields

957 The `define` and `immediate` methods will raise a
958 `PCSpecValidationException` if any of the following are true for a
959 `PCFilterSpec`:

960 • Any element of `filterList` is leads to a `PCSpecValidationException`
 961 as specified in Section 8.2.8 of the ALE specification Document.

962 The `PCFilterSpec` implements a flexible filtering scheme based on a list of
 963 `ECFilterListMember` instances (`ECFilterListMember` is shared with the
 964 ALE Reading API, and specified in Section 8.2.8 of the ALE specification
 965 Document). Each `ECFilterListMember` instances defines a test to be
 966 applied to fields of a tag to determine if the tag should cause port operations
 967 according to the containing in `PCReportSpec` to be processed. A tag raises
 968 an event to cause operations specified in the `PCReportSpec` if it passes the
 969 test specified by every `ECFilterListMember` in `filterList`, as defined in
 970 Section 8.2.7 and 8.2.8 of the ALE specification Document.

971 If accessing a field specified by any element of `filterList` causes a "field
 972 not found" or "operation not possible" condition, that tag will not be raise
 973 an event for this `PCReportSpec`.

974 9.2.5 PCOpSpec

975 Each `PCOpSpec` specifies an operation to perform on a port, such as reading
 976 a port status or setting a port status. Each `PCOpSpec` has on operation type
 977 that specifies which operation to perform and a `portSpec` that indicates
 978 which port the operation is processed on. Operations that require input
 979 state (such as setting a port status) include the state parameter to specify
 980 the input data.

	PCOpSpec
981	<code>opType</code> : <code>PCOpType</code>
982	<code>portSpec</code> : <code>PCPortSpec</code>
983	<code>state</code> : <code>Boolean</code>
984	<code>duration</code> : <code>ECTime</code>
985	<code>opName</code> : <code>String</code>
986	<<extension point>>
987	---

988 This ALE implementation interprets the fields of a `PCOpSpec` as follows:

Field	Type	Description
<code>opType</code>	<code>PCOpType</code>	Specifies the operation to be performed.
<code>portSpec</code>	<code>PCPortSpec</code>	Specifies the port to process a port operation on.
<code>State</code>	<code>Boolean</code>	(Conditional) Specifies the <code>state</code> source as a boolean value. If <code>state</code> is set to true the specified port will be activated. If <code>state</code> is set to false the specified port will be deactivated. If <code>opType</code> specifies an operation that does not require input state, this parameter must be null or omitted.

Duration	ETime	(Optional) If <code>opType</code> support duration, like setting a port status, this parameter specifies the duration to set the specified status. If duration is null or omitted the value is interpret as infinite. If <code>opType</code> does not support duration this parameter must be omitted.
opName	String	(Optional)A name for this operation within in <code>PCOpSpec</code> . If specified, the value is copied into the corresponding <code>PCOpReport</code> instance. If omitted, the <code>opName</code> parameter of the corresponding <code>PCOpReport</code> instance will be omitted as well.

Table 28: PCOpSpec Fields

The `define`, `immediate` and `execute` methods raise a `PCSpecValidationException` if any of the following are true for a `PCOpSpec` instance:

- The specified `opType` value is not one of the standard `opType` values specified in section 9.2.6.
- The `portSpec` parameter is null, omitted or invalid according to section 9.2.7.
- The specified `opType` requires a `state`, and `state` is null or omitted.
- The specified `opType` does not require `state`, and `state` is specified.
- The specified `opType` does not require `duration`, and `duration` is specified.
- When `opName` is specified, the specified `opName` is the same as an `opName` of another `PCOpSpec` within the same `PCReportSpec` instance or the list use by the `execute` method.

9.2.6 PCOpType

`PCOpType` is an enumerated type denoting what type of operation is represented by the `PCOpSpec`.

<<Enumerated Type>>	
PCOpType	
READ	
WRITE	
<<extension point>>	

The following table describes each value of `PCOpType`, and interpretation of `portSpec` and `state` within `PCOpSpec` when that `PCOpType` value is specified.

PCOpType Value	Description	portSpec	state	duration
READ	Read status from port.	The port to read.	[Must be omitted]	[Must be omitted]
WRITE	Set status of a port.	The port to set.	The value to set for the specified port.	Specifies a timespan to set the port status. If null or omitted sets the status permanently.

Table 29: PCOpType Value

9.2.7 PCPortSpec

A `PCPortSpec` defines a port to execute a port operation on:

PCPortSpec	
id :	int
reader :	String
type :	PCPortType // INPUT or OUTPUT
<<extension point>>	

This ALE implementation interprets the fields of a `PCPortSpec` as follows:

Field	Type	Description
id	int	Specifies the port <code>id</code> ; that is which port to operate upon.
Reader	String	Specifies the logical reader name; that is which <code>reader</code> to operate upon.
Type	PCPortType	Specified whether this <code>PCPortSpec</code> specifies an input or output port. If this parameter is <code>INPUT</code> , the spec defines an input port. IF this parameter is <code>OUTPUT</code> , this spec defines an output port.

Table 30: PCPortSpec Fields

The `define`, `immediate` and `execute` methods raise a `PCSpecValidationException` if any of the following are true for a `PCPortSpec`:

- The `id` parameter is null, omitted or negative number is specified.
- The `reader` parameter is null or omitted or is any logical reader name

- 1029 that is not known to the implementation.
- 1030 • The specified `type` value is not one of the standard type values specified
 - 1031 in Section 9.2.8.
 - 1032 • The specified `reader` is any logical reader name that is not a base
 - 1033 reader.

1034 9.2.8 PCPortType

1035 PCPortType is an enumerated type denoting what type of port is repre-
 1036 sented by the PCPortSpec.

	<<Enumerated Type>> PCPortType
1037	INPUT
1038	OUTPUT
1039	<<extension point>>

1040 9.2.9 PCStatProfileName

1041 Each valid value of PCStatProfileName names as statistics profile that can
 1042 be included in a PCReports

	<<Enumerated Type>> PCStatProfileName
1043	EventTimestamps
1044	EventCount
1045	ReaderNames
1046	ReaderSightingSignals
1047	<<extension point>>

- 1048 The `define`, `immediate` and `execute` methods raise a
 1049 PCSpecValidationException for any of the following circumstances:
- 1050 • If the `statProfileNames` parameter of the PCReportSpec contains
 - 1051 ReaderNames and the `triggerList` parameter is specified.
 - 1052 • If the `statProfileNames` parameter of the PCReportSpec contains
 - 1053 ReaderSightingSignals and the `triggerList` parameter is specified.

1054 9.2.10 Validation of PCSpecs

1055 The `define`, `immediate` and `execute` methods of the ALEPC API raises a
 1056 PCSpecValidationException if any of the following are true:

- 1057 • The specified `specName` is an empty string or is not accepted by the
1058 implementation according to Section 4.5 of the ALE specification Doc-
1059 ument.
- 1060 • The `logicalReaders` parameter of `PCSpec` contains any logical reader
1061 names that are not known to the implementation.
- 1062 • The `boundarySpec` parameter is null or omitted.
- 1063 • The `duration`, `repeatPeriod`, and `noNewEventsInterval` parameter
1064 of `PCBoundarySpec` is negative.
- 1065 • Any element of `startTriggerList` or `stopTriggerList` parameter of
1066 `PCBoundarySpec` does not conform to URI syntax as defined by
1067 [RFC2396], or is a URI that is not supported by the ALE implemen-
1068 tation. Note that an empty string does not conform to URI syntax as
1069 defined by [RFC2396].
- 1070 • No stopping condition is specified in `PCBoundarySpec`:
1071 i.e. `stopTriggerList` is empty, and neither `duration` nor
1072 `noNewEventsInterval` nor `whenDataAvailable` is specified.
- 1073 • Any `PCReportSpec` instance has a name that is an empty string or that
1074 is not accepted by the implementation according to Section 4.5 of the
1075 ALE specification document.
- 1076 • Two `PCReportSpec` instances have identical values for their name field.
- 1077 • The `patList` parameter of any `ECFilterListMember` instance is empty,
1078 null, or omitted, or any element of `patList` does not conform to the
1079 syntax rules for patterns implied by the specified `fieldSpec`.
- 1080 • The value of any element of `triggerList` of `PCReportSpec` does not
1081 conform to URI syntax as defined by [RFC2396], or is a URI that is not
1082 supported by the ALE implementation. Note that an empty string does
1083 not conform to URI syntax as defined by [RFC2396].
- 1084 • Both `filterSpec` and `triggerList` of `PCReportSpec` are defined for
1085 the same `PCReportSpec` instance.
- 1086 • The `logicalReaders` parameter of `PCSpec` is null, omitted or an empty
1087 list and `triggerList` parameter of any `PCReportSpec` is not specified.
- 1088 • The `opType` parameter of a `PCOpSpec` is not one of the standard `opType`
1089 values specified in Section 9.2.6.
- 1090 • The `portSpec` parameter of a `PCOpSpec` is null or omitted.
- 1091 • The `id` parameter of a `PCPortSpec` is null, omitted or has a negative
1092 value
- 1093 • The `reader` parameter of a `PCPortSpec` is null, omitted or is any logical
1094 reader name that is not known to the implementation.
- 1095 • The `opType` parameter of a `PCPortSpec` is not one of the standard type
1096 values specified in Section 9.2.8.
- 1097 • The `opType` parameter of a `PCPortSpec` requires a `dataSpec`, and
1098 `dataSpec` is null or omitted.
- 1099 • The `opType` parameter of a `PCPortSpec` does not support `dataSpec`,
1100 and `dataSpec` is specified.

- 1101 • The `opType` parameter of a `PCOpspec` does not support duration, and
1102 duration is specified.
- 1103 • Two or more `PCOpSpec` instances within the same `PCReportSpec` in-
1104 stance or the list used by the `execute` method specify the same
1105 (non-empty) `opName`.
- 1106 • Any value of `PCStatProfileName` is not recognized, or is recognized
1107 but the specified statistics report is not supported.
- 1108 • The `statProfileNames` parameter of the `PCReportSpec` contains
1109 `ReaderName` and the `triggerList` parameter is specified.
- 1110 • The `statProfileNames` parameter of the `PCReportSpec` contains
1111 `ReaderSightingSignal` and the `triggerList` parameter is specified.
- 1112 • The `reader` parameter of a `PCPortSpec` is any logical reader name that
1113 is not a base reader.

1114 9.3 PCReports

1115 The `PCReports` object is the output from a port cycle.

	PCReports
1116	<code>specName : String</code>
1117	<code>date : dateTime</code>
1118	<code>ALEID : String</code>
1119	<code>totalMilliseconds : long</code>
1120	<code>initiationCondition : PCInitiationCondition</code>
1121	<code>initiationTrigger : ECTrigger</code>
1122	<code>terminationCondition : PCTerminationCondition</code>
1123	<code>terminationTrigger : ECTrigger</code>
1124	<code>pcSpec : PCSpec</code>
1125	<code>reports : List<PCReport></code>
1126	<code><<extension point>></code>
1127	<code>---</code>

1128 The "meat" of a `PCReports` instance is the ordered list of `PCReport` in-
1129 stances, each corresponding to a `PCReportSpec` instance in the port cycle's
1130 `PCSpec`, and appearing in the order corresponding to the `PCSpec`. In addition
1131 to the reports themselves, `PCReports` contains a number of "header" fields
1132 that provide useful information about the port cycle. The implementation
1133 includes these fields according to the following definitions:

Field	Description
specName	The name of the <code>PCSpec</code> that controlled this port cycle. In the case of a <code>PCSpec</code> that was requested using the immediate method, this name is one chosen by the ALE implementation.
Date	A representation of the date and time when the port cycle ended. For bindings in which this field is represented textually, an ISO-8601 compliant representation is used.
ALEID	An identifier for the deployed instance of the ALE implementation. The meaning of this identifier is outside the scope of this specification.
totalMilliseconds	The total time, in milliseconds, from the start of the port cycle to the end of the port cycle.
initiationCondition	Indicates what kind of event caused the port cycle to initiate: the receipt of an explicit start trigger, the expiration of the repeat period, or a transition to the requested state when no start triggers were specified in the <code>PCSpec</code> . These correspond to the possible ways of specifying the start of a port cycle as defined in Section 9.2.1.
initiationTrigger	If <code>initiationCondition</code> is <code>TRIGGER</code> , the <code>ECTrigger</code> instance corresponding to the trigger that initiated the port cycle; omitted otherwise.
terminationCondition	Indicates what kind of event caused the port cycle to terminate: the receipt of an explicit stop trigger, the expiration of the port cycle duration or no events occurred for the prescribed amount of time. These correspond to the possible ways of specifying the end of a port cycle as defined in Section 9.2.1.
terminationTrigger	If <code>terminationCondition</code> is <code>TRIGGER</code> , the <code>ECTrigger</code> instance corresponding to the trigger that terminated the port cycle; omitted otherwise.
PCSpec	A copy of the <code>PCSpec</code> that generated this <code>PCReports</code> instance. Only included if the <code>PCSpec</code> has <code>includeSpecInReports</code> set to true.
Reports	A List containing a <code>PCReport</code> for each <code>PCReportSpec</code> in the corresponding <code>PCSpec</code> . See Section 9.3.3.

1134

Table 31: PCReports Fields

1135 9.3.1 PCInitiationCondition

1136 `PCInitiationCondition` is an enumerated type that describes how a port
1137 cycle was started.

<<Enumerated Type>> PCInitiationCondition	
1138	TRIGGER
1139	REPEAT_PERIOD
1140	REQUESTED
1141	UNDEFINE
1142	<<extension point>>

1143 This ALE implementation set the `initiationCondition` field of a `PCReports`
1144 instance generated at the conclusion of a port cycle according to the
1145 condition that caused the port cycle to start, as specified in the following
1146 table:

PCInitiationCondition	Event causing the port cycle to start
TRIGGER	One of the trigger specified in <code>startTriggerList</code> of <code>PCBoundarySpec</code> was received.
REPEAT_PERIOD	The <code>repeatPeriod</code> specified in the <code>PCBoundarySpec</code> expired, or the port cycle started immediately after the previous port cycle ended because neither a start trigger nor a repeat period was specified.
REQUESTED	The <code>PCSpec</code> transitioned from the unrequested state to the requested state and <code>startTriggerList</code> in <code>PCBoundarySpec</code> was empty.
UNDEFINE	Used when an outstanding poll call is terminated due to an undefined call, while the <code>PCSpec</code> was in the requested state.

1147 Table 32: PCInitiationCondition Values

1148 Each row of this table corresponds to one of the possible start conditions
1149 specified in 9.2.1.

1150 9.3.2 PCTerminationCondition

1151 `PCTerminationCondition` is an enumerated type that describes how a port
1152 cycle was ended.

<<Enumerated Type>> PCTerminationCondition	
1153	TRIGGER
1154	DURATION
1155	NO_NEW_EVENTS
1156	DATA_AVAILABLE
1157	UNREQUEST
1158	UNDEFINE
1159	<<extension point>>

1160 This ALE implementation set the `terminationCondition` field of a
1161 `PCReports` instance generated at the conclusion of a port cycle according to
1162 the condition that caused the port cycle to end, as specified in the following
1163 table:

PCTerminationCondition	Event causing the port cycle to end
TRIGGER	One of the trigger specified in stop-TriggerList of <code>PCBoundarySpec</code> was received.
DURATION	The duration specified in the <code>PCBoundarySpec</code> expired.
NO_NEW_EVENTS	No new events were raised within the <code>noNewEventsInterval</code> specified in the <code>PCBoundarySpec</code> .
DATA_AVAILABLE	The <code>whenDataAvailable</code> parameter of the <code>PCBoundarySpec</code> was true and a Port was processed.
UNREQUESTED	The <code>PCSpec</code> transitioned to the unrequested state to the requested state. By definition, this value cannot actually appear in a <code>PCReports</code> instance sent to any client.
UNDEFINE	The <code>PCSpec</code> was removed by an undefined call while in the requested or active state.

1164 Table 33: PCTerminationCondition Values

1165 Each row of this table corresponds to one of the possible stop conditions
1166 specified in 9.2.1.

1167 9.3.3 PCReport

1168 Each `PCReportSpec` in the `PCSpec` is associated with a `PCReport`.

	PCReport
1169	reportName : String
1170	eventReports : List<PCEventReport>
1171	<<extension point>>
1172	---

1173 This ALE implementation constructs a PCReport as follows:

Field	Type	Description
reportName	String	A copy of the reportName field from the corresponding PCReportSpec within the PCSpec that controlled this port cycle.
eventReport	List <PCEventReport>	An unordered list of PCEventReport instances, one for each event occurred during the port cycle that matches the filter or trigger conditions of the corresponding PCReportSpec.

1174 Table 34: PCReport Fields

1175 9.3.4 PCEventReport

1176 A PCEventReport describes what happened during the processing of a
1177 single event that cause operations on a port to be processed.

	PCEventReport
1178	id : String
1179	opReports : List<PCOpReport>
1180	stats : List<PCEventStat>
1181	<<extension point>>
1182	---

1183 This ALE implementation constructs a PCEventReport from operation pro-
1184 cessed on a single Port, as follows:

Field	Type	Description
id	String	A data value that identifies the event that caused the operation to be processed. This could be either a epc-tag or a trigger-urn if a trigger depending on what kind of matching event occurred.

opReports	List<PCOpReport>	An unordered list of PCOpReport instances, one for each of the corresponding PCOpSpec instances in the corresponding PCReportSpec in the corresponding order.
Stats	List<PCEventStat>	Null, if the statProfileNames parameter of the corresponding PCReportSpec is empty, omitted, or null. Otherwise, contains a PCEventStat for each statistics profile named in the statProfileNames parameter of the corresponding PCReportSpec, in the corresponding order.

1185 Table 35: PCEventReport Fields

1186 9.3.5 PCOpReport

1187 A PCOpReport contains the result of a single PCOpSpec executing on a port
1188 during a port cycle.

PCOpReport	
1189	state : Boolean // Conditional
1190	opStatus : PCOpStatus
1191	opName : String // Conditional
1192	<<extension point>>
1193	---

1194 This ALE implementation constructs a PCOpReport as follows:

Field	Type	Description
state	Boolean	(Conditional) The result of the operation, according to the table below, or null if an error occurred.
opStatus	PCOpStatus	Specifies whether the operation succeeded or failed (see Section 9.3.6).
opName	String	(Conditional) A copy of the opName parameter of the corresponding PCOpSpec. Omitted if the opName parameter was omitted from the corresponding PCOpSpec.

1195 Table 36: PCOpReport Fields

1196 The value of the data field is constructed according to the following table:

PCOpType Value	Description	state Value
READ	Read port status.	The boolean value that was read from the port status which indicates if the port is activated or not.
WRITE	Set port status.	The value is omitted.

Table 37: PCOpReport state Field Values

9.3.6 PCOpStatus

PCOpStatus is an enumerated value that lists the several possible outcomes for a given operation.

<<Enumerated Type>> PCOpStatus	
SUCCESS	
MISC_ERROR_TOTAL	
MISC_ERROR_PARTIAL	
PORT_NOT_FOUND_ERROR	
OP_NOT_POSSIBLE_ERROR	
<<extension point>>	

The codes that contain ERROR in their names are errors that arise during the interaction between the ALE implementation and the Port. This ALE implementation returns PCOpStatus codes according to the following table:

Status Code	Description
SUCCESS	The operation completed successfully.
MISC_ERROR_TOTAL	An error occurred during the processing of this operation that resulted in total failure. The state of the Port following the operation is unchanged. The ALE implementation returns this code only if no more specific code applies.
MISC_ERROR_PARTIAL	An error occurred during the processing of this operation that resulted in partial failure. The state of the Port following the operation attempt is indeterminate.

PORT_NOT_FOUND_ERROR	The specified port of the reader was not found.
OP_NOT_POSSIBLE_ERROR	The specified operation is not possible on the specified port or on the specified reader.

Table 38: PCOpStatus Values

9.3.7 PCEventStat

A `PCEventStat` provides additional, implementation-defined information about each “occurring” of an event, which is, each time an event acquired by one of the Reader participating in the port cycle.

PCEventStat	
profile :	PCStatProfileName
statBlocks :	List<ECReaderStat>
<<extension point>>	

The ALE implementation constructs a `PCEventStat` as follows:

Field	Type	Description
profile	PCStatProfileName	The name of the statistics profile that governed the generation of this <code>PCEventStat</code> instance.
statBlocks	List<ECReaderStat>	An unordered list containing an <code>ECReaderStat</code> instance for each Reader that occurred this event.

Table 39: PCEventStat Fields

9.3.8 PCEventTimestampStat

`PCEventTimestampStat` is a subclass of `PCEventStat`. The ALE implementation includes one `PCEventTimestampStat` in a `PCEventReport` if the `EventTimestamp` statistics profile was included in the corresponding `PCReportSpec`.

`PCEventTimestampStat` includes all of the fields in `PCEventStat`, plus the following additional fields:

PCEventTimestampStat	
firstOccurringTime :	dateTime
lastOccurringTime :	dateTime

1232 The ALE implementation constructs a `PCEventTimestampStat` as follows:

Field	Type	Description
profile	PCStatProfileName	This field contains the EventTimestamp value of PCStatProfileName.
statBlock	List<ECReaderStat>	This field contains an empty list.
firstOccurring Time	dateTime	This field contains the first time within this port cycle that the event occurred by any reader contributing to this port cycle.
lastOccurring Time	dateTime	This field contains the last time within this port cycle that the event occurred by any reader contributing to this port cycle.

1233 Table 40: PCEventTimestampStat Fields

1234 **9.3.9 PCEventCountStat**

1235 `PCEventCountStat` is a subclass of `PCEventStat`. The ALE implementation
1236 includes one `PCEventCountStat` in a `PCEventReport` if the EventCount
1237 statistics profile was included in the corresponding `PCReportSpec`.
1238 `PCEventCountStat` includes all of the fields in `PCEventStat`, plus the fol-
1239 lowing additional fields:

PCEventCountStat	
count : int	

1242 The ALE implementation constructs a `PCEventCountStat` as follows:

Field	Type	Description
profile	PCStatProfileName	This field contains the EventCount value of PCStatProfileName.
statBlock	List<ECReaderStat>	This field contains an empty list.
Count	int	This field contains the count how often this event occurred within this port cycle by any reader contributing to this port cycle.

1243 Table 41: PCEventCountStat Fields

1244 **9.4 ALEPCCallback Interface**

1245 The `ALEPCCallback` interface is the path by which this ALE implementation
1246 delivers asynchronous results from port cycles to subscribers.

	<code><<interface>></code>
	<code>ALEPCCallback</code>
1247	<code>callbackResults (reports : PCReports) : void</code>
1248	<code>---</code>

1249 Referring to the state transition tables in Section 5.6.1 of the ALE specifica-
1250 tion Document, whenever a transition specifies that "reports are delivered
1251 to subscribers" this ALE implementation attempts to deliver the results to
1252 each subscriber by invoking the `callbackResults` method of the ALEPC-
1253 Callback interface once for each subscriber, passing the `PCReports` for the
1254 port cycle as specified by the notification URI for that subscriber as spec-
1255 ified in the `subscribe` call. All subscribers receive an identical `PCReports`
1256 instance.

1257 **10 Bindings for the Callback APIs**

1258 This section specifies XML-based bindings for ALECallback, ALECCallback
1259 and ALEPCCallback interfaces, through which the ALE Reading API, the
1260 ALE Writing API and the ccr Input and Output API, respectively, deliver
1261 asynchronous notifications to subscribers. Each binding of these interfaces
1262 specifies a syntax for notification URIs. A notification URI is supplied by
1263 an ALE client as a parameter of the `subscribe` and `unsubscribe` methods
1264 of the ALE Reading, Writing API or Digital Input and Output API. The
1265 notification URI both selects a binding of the callback interface to be used for
1266 that subscriber, and provides addressing information in a manner specified
1267 by each binding below.

1268 **10.1 HTTP Binding**

1269 The HTTP bindings of the ALECallback, ALECCallback and ALEPCCallback
1270 interfaces provide for delivery of ECRports, CCReports or PCReports,
1271 respectively, in XML via the HTTP protocol using the POST operation.

1272 The syntax for HTTP notification URIs as used by these bindings is defined
1273 in RFC2616. Informally, an HTTP URI has one of the two following forms:

1274 <http://host:port/remainder-of-URL>

1275 <http://host/remainder-of-URL>

1276 where

- 1277 • `host` is the DNS name or IP address of the host where the callback
1278 receiver is listening for incoming HTTP connections.
- 1279 • `port` is the TCP port on which the callback receiver is listening for
1280 incoming HTTP connections. The port and the preceding colon character
1281 may be omitted, in which case the port defaults to 80.
- 1282 • `remainder-of-URL` is the URL to which an HTTP POST operation will be
1283 directed.

1284 The HARTING IT Software Development GmbH & Co KG vendor implemen-
1285 tation delivers event cycle, command cycle or port cycle reports by sending
1286 an HTTP POST request to the callback receiver designated in the URI, where
1287 `remainder-of-URL` is included in the HTTP `request-line`, and where the
1288 payload is the ECRports instance, CCReports instance or PCReports in-
1289 stance encoded in XML according to the schema.

1290 This ALE implementation does not interpret the response code value re-
1291 turned by the callback receiver. Therefore the implementation interprets
1292 any response code that is not null as a normal response, not indicative of
1293 any error.

1294 **10.2 TCP Binding**

1295 The TCP binding of the ALECallback, ALECCallback and ALEPCCallback
1296 interfaces provide for delivery of ECRports, CCReports or PCReports,
1297 respectively, in XML via a raw TCP connection.

1298 The syntax for TCP notification URIs as used by these bindings is defined in
1299 RFC2396. Informally, a TCP URI has the following form:

1300 tcp://host:port

1301 where

- 1302 • `host` is the DNS name or IP address of the host where the callback
1303 receiver is listening for incoming TCP connections.
- 1304 • `port` is the TCP port on which the callback receiver is listening for
1305 incoming TCP connections.

1306 The HARTING IT Software Development GmbH & Co KG vendor implemen-
1307 tation delivers event cycle, command cycle or port cycle reports by opening
1308 a new TCP connection to the specified host and port, writing to the connec-
1309 tion the `ECReports` instance, `CCReports` instance or `PCReports` instance,
1310 encoded in XML according to the schema and then closing the connection.
1311 The implementation does not require a reply or acknowledgement.

1312 **10.3 UDP Binding**

1313 The UDP binding of the `ALECallback`, `ALECCCallback` and `ALEPCCallback`
1314 interfaces provide for delivery of `ECReports`, `CCReports` or `PCReports`,
1315 respectively, in XML via a raw UDP connection.

1316 The syntax for UDP notification URIs as used by these bindings is defined
1317 in RFC2396. Informally, a UDP URI has the following form:

1318 udp://host:port

1319 where

- 1320 • `host` is the DNS name or IP address of the host where the callback
1321 receiver is listening for incoming UDP data.
- 1322 • `port` is the UDP port on which the callback receiver is listening for
1323 incoming UDP data.

1324 The HARTING IT Software Development GmbH & Co KG vendor imple-
1325 mentation delivers event cycle, command cycle or port cycle reports by
1326 directly writing the `ECReports` instance, `CCReports` instance or `PCReports`
1327 instance, encoded in XML according to the schema, to the UDP socket. The
1328 implementation does not require a reply or acknowledgement.

1329 **10.4 SQL Binding**

1330 The HARTING IT Software Development GmbH & Co KG vendor implemen-
1331 tation provides different SQL bindings of the `ALECallback`, `ALECCCallback`
1332 and `ALEPCCallback` interfaces for delivery of `ECReports`, `CCReports` or
1333 `PCReports`, in SQL statement via the an SQL INSERT operation. The follow-
1334 ing chapters will describe the different SQL bindings and in chapter 10.4.2
1335 the mapping option for all these bindings will be described as well.

1336 The database drivers to access H2 databases are included in this implemen-
1337 tation, all other drivers, e.g. MySQL, PostgreSQL or Microsoft SQL, must
1338 be installed manually. Please contact HARTING IT Software Development
1339 GmbH & Co KG to request the necessary drivers.

1340 The syntax for SQL notification URIs as used by this binding is defined
1341 below. Informally, a SQL URI has one of two the following forms:

```
1342 sql://?connection=$ConnectionString$
1343         &table=$TableName$
1344         &plain=$ColumnName$
1345
```

```
1346 sql://?connection=$ConnectionString$
1347         &table=$TableName$
1348         &storage=$StorageName$
1349         &init=$InitTable$
1350         &clear=$ClearTable$
1351         &drop=$DropTable$
1352         &$ColumnMappingList$
1353
```

1354 where

- 1355 • `connection` specifies the JDBC connection string of the database
1356 (i.e. for MySQL: `jdbc:mysql://<MySQL Server Host>:3306/db1` or
1357 for in memory data storage: `jdbc:h2:mem:db1`).
- 1358 • `table` specifies a table name of the table within the database.
- 1359 • `plain` specifies a column name within the table where the implemen-
1360 tation will write to the `ECReports` instance, `CCReports` instance or
1361 the `PCReports` instance encoded in XML according to the schema. If
1362 omitted the column mapping will be used instead.
- 1363 • `storage` optionally specifies a name to allow exporting the table entries
1364 (via HTTP GET with a `text/plain` response formatted in CSV) and to be
1365 able to delete them (via HTTP DELETE) while the subscriber is active.
1366 Note, this only works correctly when defining the `ColumnMappingList`.
- 1367 • `init` optionally specifies whether the database table will be created on
1368 a `subscribe` call.
- 1369 • `clear` optionally specifies whether the database table entries will be
1370 deleted on a `subscribe` call.
- 1371 • `drop` optionally specifies whether the database table will be dropped
1372 on a `unsubscribe` call.
- 1373 • `ColumnMappingList` is a list of query parameters that will map specific
1374 information from an `ECReports`, `CCReports` or `PCReports` instance
1375 into the specified column within the table. This ALE implementation
1376 will interpret these parameters as defined in section 10.4.2.

1377 The HARTING IT Software Development GmbH & Co KG vendor implemen-
1378 tation delivers event cycle, command cycle or port cycle reports by sending
1379 one or more INSERT operations to the specified table and columns within
1380 the database, and where the values are the `ECReports` instance, `CCReports`
1381 instance or `PCReports` instance information mapped on columns as speci-
1382 fied through the URI see section 10.4.2 for mapping options.

1383 10.4.1 SQL Timeout Options

1384 This ALE implementation provides no option to set a general socket or
1385 connect timeout for connections to remote databases. Please set the vendor
1386 specific socket or connect timeout parameter in the JDBC connection string.

1387 10.4.2 SQL Binding Mapping Options

1388 This ALE implementation provides the two mapping options plain and col-
1389 umn mapping. If the plain parameter is specified the implementation will
1390 insert the complete `ECReports`, `CCReports` or `PCReports` instance en-
1391 coded in XML according to schema in a single column within the table.
1392 If omitted the column mapping will be used instead, where one INSERT
1393 operation will be send to the database for each
1394 `ECReportGroupListMember` within an `ECReports`, `CCOpReport` within a
1395 `CCReports` or `PCOpReport` within a `PCReports`. The implementation recog-
1396 nizes the parameters defined in the next three sub-sections for the column
1397 mapping options.

1398 10.4.2.1 ECReports

1399 The HARTING IT Software Development GmbH & Co KG vendor implemen-
1400 tation provides SQL binding mapping parameters for `ECReports` as specified
1401 in the below table.

Parameter	Related Information	Description
<code>spec</code>	<code>ECReports.spec</code>	If specified the <code>spec</code> parameter within the <code>ECReports</code> will be inserted in the column according to the value. (i.e. <code>spec=SpecColumn</code>)
<code>date</code>	<code>ECReports.date</code>	If specified the <code>date</code> parameter within the <code>ECReports</code> will be inserted in the column according to the value. (i.e. <code>date=DateColumn</code>)
<code>total Milli seconds</code>	<code>ECReports.total Milliseconds</code>	If specified the <code>totalMilliseconds</code> parameter within the <code>ECReports</code> will be inserted in the column according to the value. (i.e. <code>totalMilliseconds=TotalMillisecondsColumn</code>)
<code>initiation Condition</code>	<code>ECReports.initiation Condition</code>	If specified the <code>initiationCondition</code> parameter within the <code>ECReports</code> will be inserted in the column according to the value. (i.e. <code>initiationCondition=InitiationConditionColumn</code>)

initiation Trigger	ECReports.initiation Trigger	If specified the initiationTrigger parameter within the ECReports will be inserted in the column according to the value. (i.e. initiationTrigger=InitiationTriggerColumn)
termination Condition	ECReports.termination Condition	If specified the terminationCondition parameter within the ECReports will be inserted in the column according to the value. (i.e. terminationCondition=TerminationConditionColumn)
termination Trigger	ECReports.termination Trigger	If specified the terminationTrigger parameter within the ECReports will be inserted in the column according to the value. (i.e. terminationTrigger=TerminationTriggerColumn)
report	ECReports.ECReport. reportName	If specified the reportName parameter within the ECReport will be inserted in the column according to the value.(i.e. report=ReportNameColumn)
group	ECReports.ECReport. ECReportGroup. groupName	If specified the groupname parameter within the ECReporGroup will be inserted in the column according to the value.(i.e. group=GroupNameColumn)

count	ECReports.ECReport. ECReportGroup. groupCount	If specified the groupCount parameter within the ECReportGroup will be inserted in the column according to the value.(i.e. group=GroupNameColumn)
epc	ECReports.ECReport. ECReportGroup ECReportGroupList Member.epc	If specified the epc parameter within the ECReportGroupListMember will be inserted in the column according to the value.(i.e. epc=EPCColumn)
tag	ECReports.ECReport. ECReportGroup ECReportGroupList Member.tag	If specified the tag parameter within the ECReportGroupListMember will be inserted in the column according to the value.(i.e. tag=TagColumn)
rawHex	ECReports.ECReport. ECReportGroup ECReportGroupList Member.rawHex	If specified the rawHex parameter within the ECReportGroupListMember will be inserted in the column according to the value.(i.e. rawHex=RawHexColumn)
field	ECReports.ECReport. ECReportGroup ECReportGroupList Member.ECReport MemberField.value	A parameter to specify a comma separated list of column names. If specified the value parameter of each member of the fieldList parameter within the ECReportGroupListMember will be inserted in order of their appearance in the next specified column. (i.e. field=Field1, Field2, Field3) If fewer columns then fields are specified the remaining fields will be omitted from the INSERT operation.

Table 42: ECReports SQL Binding Parameter

1403 Through the notification URI each parameter could be assigned to a column
 1404 within the database table. If a parameter is omitted the related information
 1405 from the `ECReports` will be omitted in the INSERT operation as well.

1406 **10.4.2.2 CCReports**

1407 The HARTING IT Software Development GmbH & Co KG vendor implemen-
 1408 tation provides SQL binding mapping parameters for `CCReports` as specified
 1409 in the below table.

Parameter	Related Information	Description
spec	<code>CCReports.spec</code>	If specified the <code>spec</code> parameter within the <code>CCReports</code> will be inserted in the column according to the value. (i.e. <code>spec=SpecColumn</code>)
date	<code>CCReports.date</code>	If specified the <code>date</code> parameter within the <code>CCReports</code> will be inserted in the column according to the value. (i.e. <code>date=DateColumn</code>)
total Milli seconds	<code>CCReports.total Milliseconds</code>	If specified the <code>totalMilliseconds</code> parameter within the <code>CCReports</code> will be inserted in the column according to the value. (i.e. <code>totalMilliseconds=TotalMillisecondsColumn</code>)
initiation Condition	<code>CCReports.initiation Condition</code>	If specified the <code>initiationCondition</code> parameter within the <code>CCReports</code> will be inserted in the column according to the value. (i.e. <code>initiationCondition=InitiationConditionColumn</code>)
initiation Trigger	<code>CCReports.initiation Trigger</code>	If specified the <code>initiationTrigger</code> parameter within the <code>CCReports</code> will be inserted in the column according to the value. (i.e. <code>initiationTrigger=InitiationTriggerColumn</code>)
termination Condition	<code>CCReports.termination Condition</code>	If specified the <code>terminationCondition</code> parameter within the <code>CCReports</code> will be inserted in the column according to the value. (i.e. <code>terminationCondition=TerminationConditionColumn</code>)

termination Trigger	CCReports.termination Trigger	If specified the <code>terminationTrigger</code> parameter within the <code>CCReports</code> will be inserted in the column according to the value. (i.e. <code>terminationTrigger=TerminationTriggerColumn</code>)
report	CCReports.CCCmdReport. cmdSpecName	If specified the <code>cmdSpecName</code> parameter within the <code>CCCmdReport</code> will be inserted in the column according to the value.(i.e. <code>report=ReportNameColumn</code>)
id	CCReports.CCCmdReport. CCTagReport.id	If specified the <code>id</code> parameter within the <code>CCTagReport</code> will be inserted in the column according to the value.(i.e. <code>group=IdColumn</code>)
name	CCReports.CCCmdReport. CCTagReport.CCOpReport opName	If specified the <code>opName</code> parameter within the <code>CCOpReport</code> will be inserted in the column according to the value.(i.e. <code>name=NameColumn</code>)
status	CCReports.CCCmdReport. CCTagReport.CCOpReport opStatus	If specified the <code>opStatus</code> parameter within the <code>CCOpReport</code> will be inserted in the column according to the value.(i.e. <code>tag=StatusColumn</code>)
data	CCReports.CCCmdReport. CCTagReport.CCOpReport data	If specified the <code>data</code> parameter within the <code>CCOpReport</code> will be inserted in the column according to the value.(i.e. <code>data=DataColumn</code>)

1410

Table 43: CCReports SQL Binding Parameter

1411 Through the notification URI each parameter could be assigned to a column
 1412 within the database table. If a parameter is omitted the related information
 1413 from the `CCReports` will be omitted in the INSERT operation as well.

1414 10.4.2.3 PCReports

1415 The HARTING IT Software Development GmbH & Co KG vendor implemen-
 1416 tation provides SQL binding mapping parameters for `PCReports` as specified
 1417 in the below table.

Parameter	Related Information	Description
spec	PCReports.spec	If specified the <code>spec</code> parameter within the <code>PCReports</code> will be inserted in the column according to the value. (i.e. <code>spec=SpecColumn</code>)

date	PCReports.date	If specified the date parameter within the PCReports will be inserted in the column according to the value. (i.e. date=DateColumn)
total Milli seconds	PCReports.total Milliseconds	If specified the totalMilliseconds parameter within the PCReports will be inserted in the column according to the value. (i.e. totalMilliseconds=TotalMillisecondsColumn)
initiation Condition	PCReports.initiation Condition	If specified the initiationCondition parameter within the PCReports will be inserted in the column according to the value. (i.e. initiationCondition=InitiationConditionColumn)
initiation Trigger	PCReports.initiation Trigger	If specified the initiationTrigger parameter within the PCReports will be inserted in the column according to the value. (i.e. initiationTrigger=InitiationTriggerColumn)
termination Condition	PCReports.termination Condition	If specified the terminationCondition parameter within the PCReports will be inserted in the column according to the value. (i.e. terminationCondition=TerminationConditionColumn)
termination Trigger	PCReports.termination Trigger	If specified the terminationTrigger parameter within the PCReports will be inserted in the column according to the value. (i.e. terminationTrigger=TerminationTriggerColumn)
report	PCReports.PCReport. reportName	If specified the reportName parameter within the PCEventReport will be inserted in the column according to the value.(i.e. report=ReportNameColumn)
id	PCReports.PCReport. PCEventReport.id	If specified the id parameter within the PCEventReport will be inserted in the column according to the value.(i.e. group=IdColumn)
name	PCReports.PCReport. PCEventReport. PCOpReport.opName	If specified the opName parameter within the PCOpReport will be inserted in the column according to the value.(i.e. name=NameColumn)

status	PCReports.PCReport. PCEventReport. PCOpReport.opStatus	If specified the opStatus parameter within the PCOpReport will be inserted in the column according to the value.(i.e. tag=StatusColumn)
data	PCReports.PCReport. PCEventReport. PCOpReport.data	If specified the data parameter within the PCOpReport will be inserted in the column according to the value.(i.e. data=DataColumn)

Table 44: PCReports SQL Binding Parameter

Through the notification URI each parameter could be assigned to a column within the database table. If a parameter is omitted the related information from the PCReports will be omitted in the INSERT operation as well.

10.5 MQTT Binding

The MQTT bindings of the ALECallback, ALECCallback and ALEPCallback interfaces provide for delivery of EReports, CReports or PCReports, respectively, as JSON strings via the MQTT publish method.

The syntax for MQTT notification URIs as used by these binding is defined in RFC3986 and must be percent-encoded. Informally, a MQTT URI has one of the following forms:

```
mqtt://[username[:password]]@host[:port]/topic
      ?clientId=$ClientID$
      &qos=$qos$
```

where

- `username` is the username for the authentication. The username and the following password may be omitted, in which case no user and password is used for authorization nor authentication.
- `password` is the password for the authorization of the user. The password and the preceding colon character may be omitted, in which case no password is used for authorization.
- `host` is the DNS name or IP address of the MQTT Broker where the callback receiver is listening for incoming MQTT connections.
- `port` is the TCP port on which the callback receiver is listening for incoming MQTT connections. The port and the preceding colon character may be omitted, in which case the port defaults to 1883.
- `topic` is the topic on which the report will be published. A topic consists of one or more topic levels, where each level is separated by a forward slash. Each topic must have at least 1 character to be valid and it can also contain spaces. Also a topic is case sensitive. Additionally the forward slash alone is a valid topic, too. A topic can contain one or more placeholders, which will be replaced by the values of the current report. Each placeholder must be in curly brackets. (i.e. `{report}`, `{reader}`, `{antenna}`). If the value is not available in the

1453 current report the placeholder will be replaced by an empty string.
1454 This ALE implementation will interpret these placeholders as defined in
1455 section Placeholder.

- 1456 • `clientid` is the id of the client which will be used to established the
1457 MQTT connection
- 1458 • `qos` is the quality of service value which will be used to publish.
1459 (0 = At most once; 1 = At least once, 2 = exactly once)

1460 The HARTING IT Software Development GmbH & Co KG vendor imple-
1461 mentation delivers event cycle, command cycle or port cycle reports by
1462 executing a MQTT publish command to the specified MQTT Broker and
1463 topic, while the message will be encoded in JSON format.

1464 **11 ALE Web Service URLs**

1465 The HARTING IT Software Development GmbH & Co KG vendor implemen-
1466 tation provides the following ALE web service URIs:

ALE Web Service URIs	
1467	EC: <a href="http://<Container Host>:8888/services/ALE/EC?wsdl">http://<Container Host>:8888/services/ALE/EC?wsdl
1468	---
1469	LR: <a href="http://<Container Host>:8888/services/ALE/LR?wsdl">http://<Container Host>:8888/services/ALE/LR?wsdl
1470	---
1471	TM: <a href="http://<Container Host>:8888/services/ALE/TM?wsdl">http://<Container Host>:8888/services/ALE/TM?wsdl
1472	---
1473	CC: <a href="http://<Container Host>:8888/services/ALE/CC?wsdl">http://<Container Host>:8888/services/ALE/CC?wsdl
1474	---
1475	PC: <a href="http://<Container Host>:8888/services/ALE/PC?wsdl">http://<Container Host>:8888/services/ALE/PC?wsdl
1476	---
1477	Trigger: <a href="http://<Container Host>:8888/services/ALE/trigger/">http://<Container Host>:8888/services/ALE/trigger/
